

WISHI

Michael Koster + Chairs

Workshop on IoT Semantic/Hypermedia Interoperability

- 8 calls after the IETF 100 WISHI hackathon - topics include:
 - Review of existing semantic capabilities - IPSO/LWM2M, OCF, Web links, W3C WoT, CORAL
 - Semantic annotation with RDF ontologies
 - Using third party vocabularies (QUDT, SOSA, SSN, iotschema)
 - Design patterns for semantic metadata integration
 - Layered semantic stack, e.g. SenML + RDF
 - The nature of abstract semantics; high level data and interaction models
 - Binding abstract semantics to concrete protocols
 - Semantic annotation for the context of connected things, features of interest
 - Extend the collaboration with other SDOs around semantic interoperability
 - Planning for IETF Hackathons
 - Interoperability across data types and engineering units

Wishi Hackathon at IETF 101 - High Level Goals

- Bring diverse connected things to interoperate
- Start with directory based discovery using semantic annotation
- Experiment with software adaptation to data models and protocols
- CoAP, HTTP, MQTT protocols
- Simple application scenarios; turn on a light with a motion sensor
- First hands-on experiments

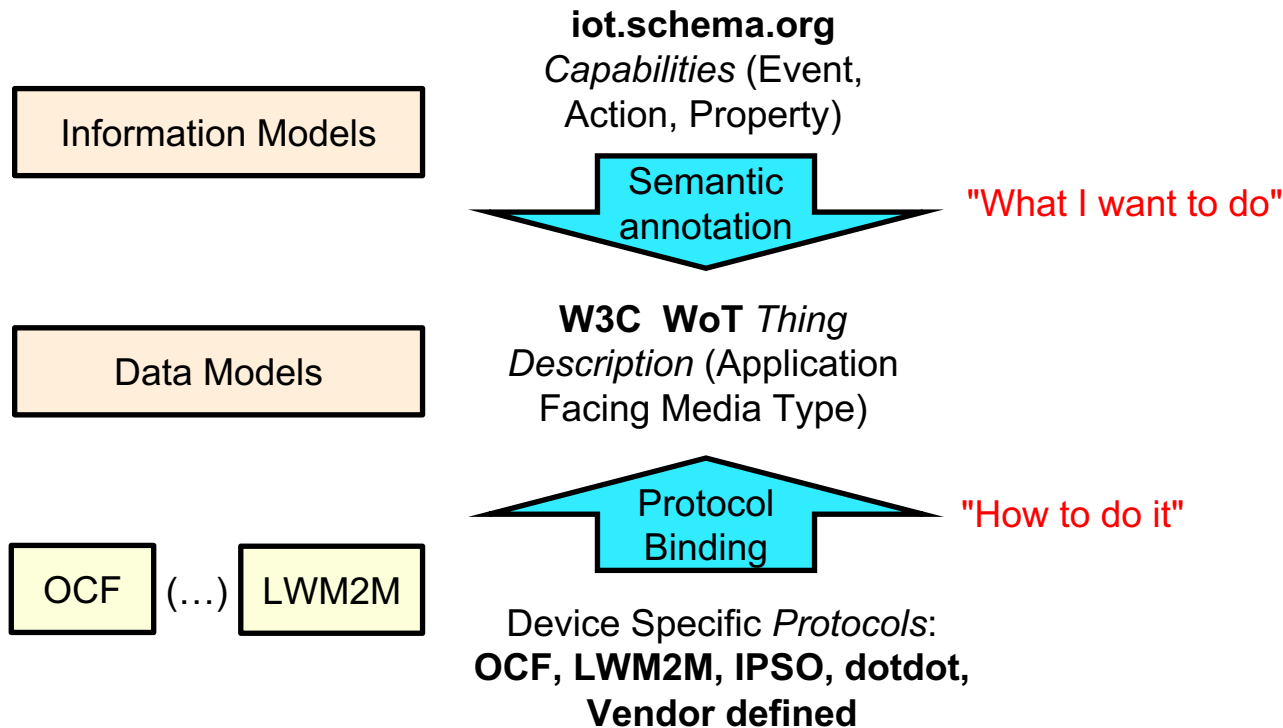

Wishi Hackathon at IETF 101

- What implementations do we have?
 - W3C WoT
 - YANG & CoMI
 - OMA LwM2M Managed Server and Client
 - Ad-hoc device APIs and data models
 - Connected home and automotive domains
- How can we make them work together?
 - Role of W3C Web of Things technology
- Results
 - Thing Descriptions (TD) generated from LwM2M management server
 - CoMI implementation described by YANG re-described with TD
 - TDs stored in Thing Directory, and consumed by WoT implementation
 - WoT implementation communicating directly with all three implementations

W3C Web of Things - Thing Description

- TD is a file format and mediatype of RDF
- Describes abstract Interactions with things
 - Read temperature
 - Lock the door
 - Change the brightness of a light
- Binds to concrete instances that implement the interactions
 - Defines data shape, payload structure
 - Defines data types and range
 - Transfer layer instructions including URI, methods, options
- Applications use abstract interactions to decouple from the underlying implementation
- Any application, any network, any connected thing, using automated software adaptation

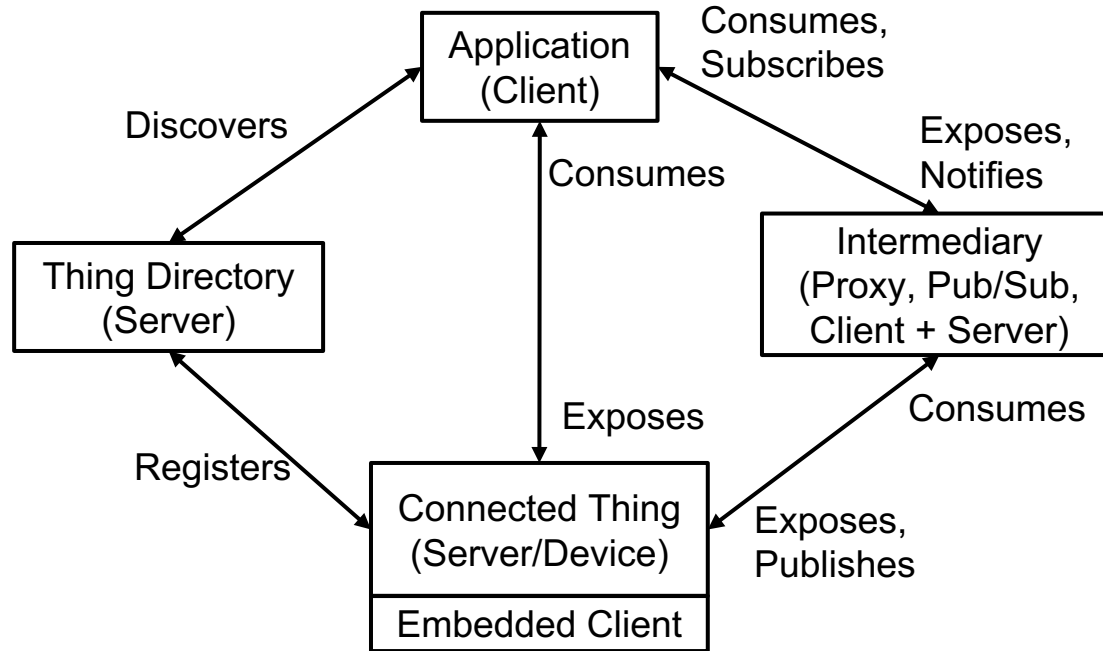

Layered Scope in Data Models and Information Models

Thing Directory

- Things register their metadata with semantic annotation to a Thing Directory
- Applications can discover the capabilities of registered things based on the semantic annotation
- One or more thing directories with well known entry points
- Semantic discovery and thing integration into the application
 - Submit a semantic query to the Thing Directory indicating the required capability types (temperature measurement, light control, door lock)
 - Retrieve Thing Descriptions from registered things that satisfy the query
 - Select Things to integrate into the application that have the required interactions (e.g. color temperature control for a light)
 - Use the protocol binding part of the TD to construct payloads and perform methods on the desired things

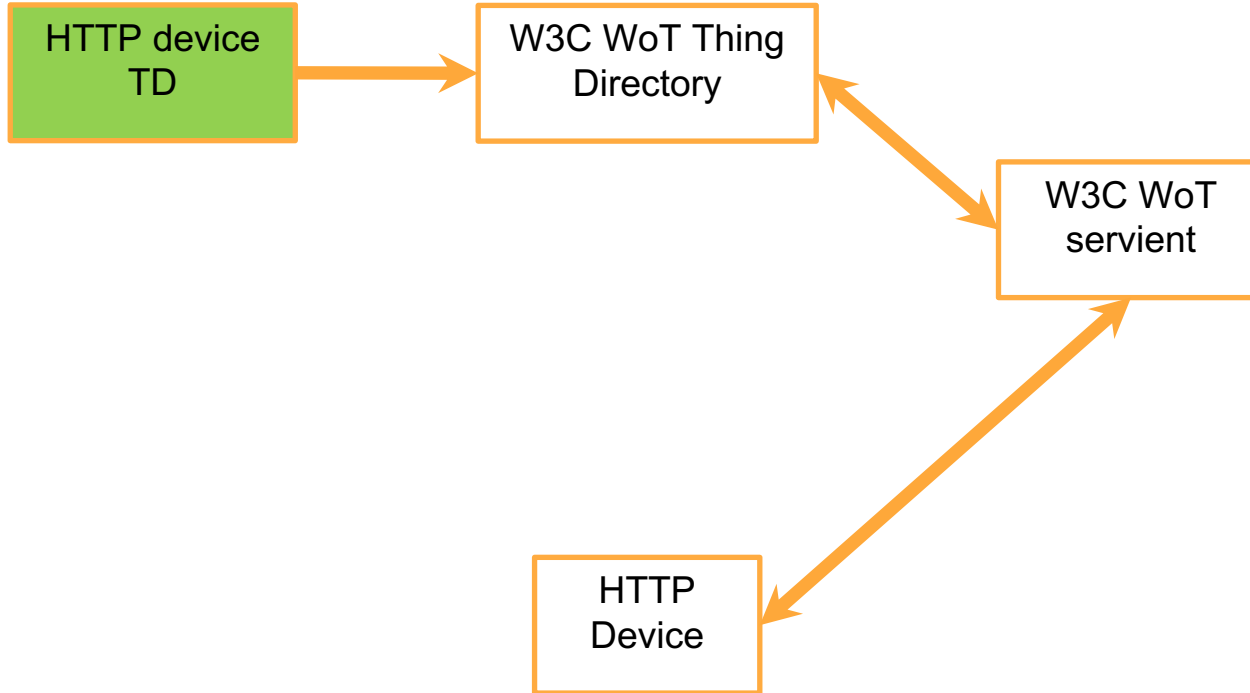

Interop Schematic Diagram – Roles and Interactions

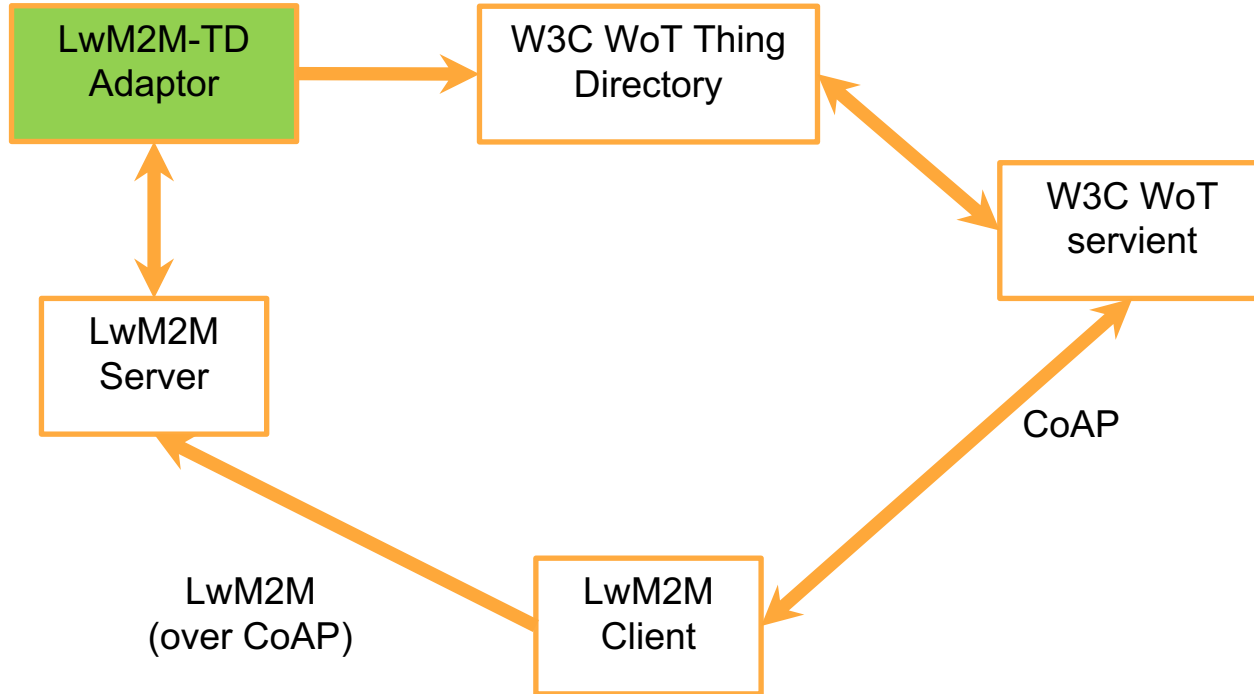

CoMI device integration

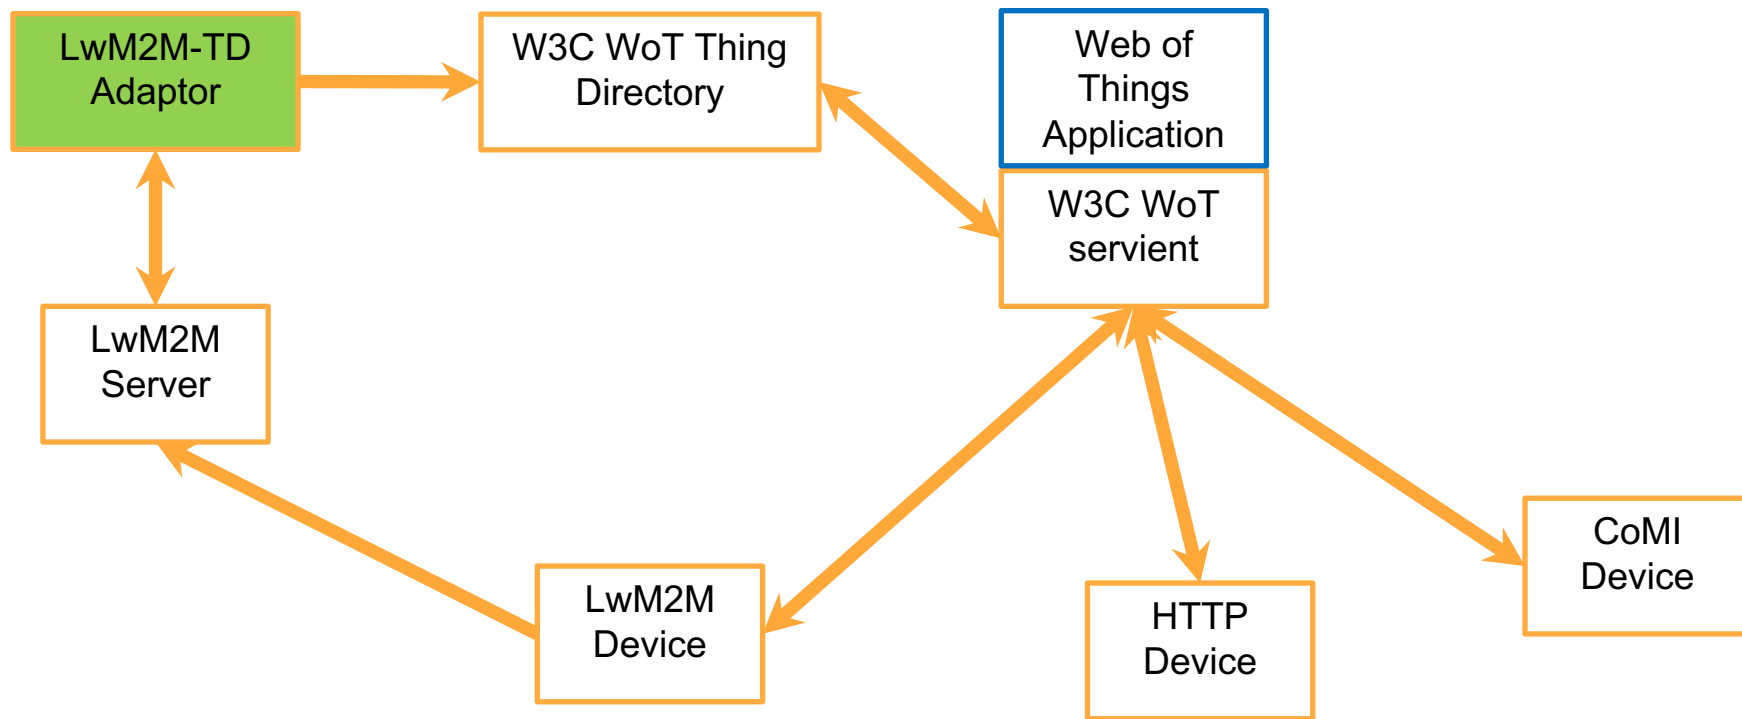

HTTP Device Integration

LwM2M Client & Server integration

Putting things together with

Next Steps

- Experiment with semantic annotation and discovery using CoRE RD and CoRE Link-format
- Experiment with more diverse end device protocols and data models
- More automation of semantic queries - SPARQL syntax from URI-query options
- Automation of protocol bindings using software adaptation or translation
- Binding device capabilities to external Features of Interest (binding an instance of a thing with door lock capability to a specific door of your house) for contextual discovery
- More sophisticated applications, device to device orchestration
